

FIGURE S1. Core-gene maximum likelihood phylogenetic tree showing the relationship of Haiti environmental *Vibrio cholerae* isolates (I) to several reference genomes and to the Haiti outbreak clone.<sup>30,31</sup>

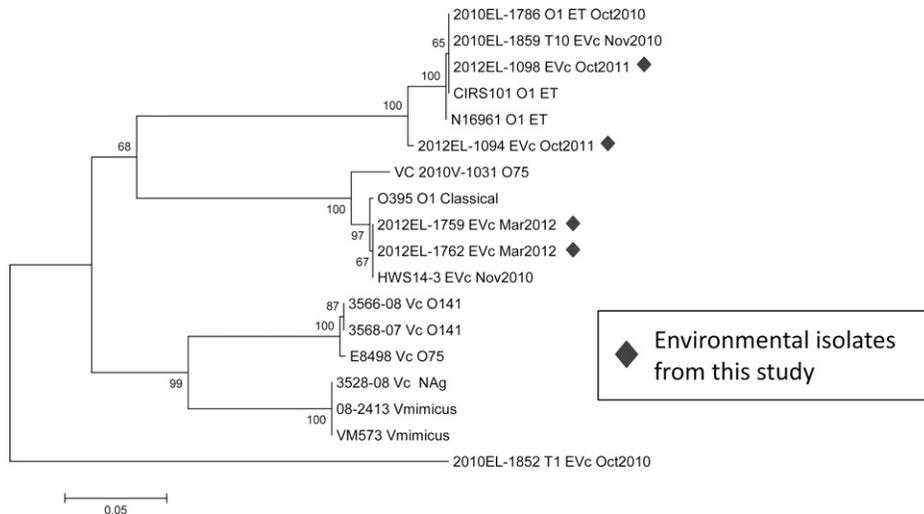

FIGURE S2. Environmental isolates from Haiti (I) in global *Vibrio cholerae-mimicus tcpA* phylogeny tree constructed using the Neighbor-Joining method with a statistical bootstrap test (500 replicates). The analysis involved 18 nucleotide sequences. There were a total of 675 positions in the final data set. Phylogeny constructed in MEGA5. ET = El Tor; EVc = environmental *Vibrio cholerae*; Nag = non-agglutinating in O1, O139, O75, and O141 antisera.
